Featured Projects

AquaCheck La Ceja

Python, Flask, Dash, SQLite, Pandas, Plotly, Bootstrap

Comprehensive water quality monitoring system that I developed for La Ceja, implementing a full-stack architecture. I designed an optimized SQLite database to capture and store critical water parameters, along with an interactive web interface using Dash and Bootstrap. The system features advanced analytical visualizations through Plotly, allowing for real-time identification of trends and anomalies. I implemented a complete CRUD system for efficient data management and configured automated deployment on the Render platform, ensuring high availability and performance.

Interactive Digital Curriculum Vitae

HTML5, CSS3, Responsive Design, Flexbox, CSS Grid

I developed this digital CV from scratch applying modern web development techniques. I implemented a responsive design using CSS Grid and Flexbox to ensure optimal display on any device. I created a visual system to represent technical and professional skills through dynamic progress bars. The design includes subtle transitions to enhance user experience and is structured with semantic HTML to maximize accessibility and SEO. The layout contemplates both digital visualization and printing, demonstrating versatility in presenting personal and professional information.
